DATIM Release 1.18c was deployed on December 22nd, 2016.

DATIM v1.18c is a follow on release to address some of the issues from release v1.18.

Resolved Defects:

1. **User Invite error fix (Request to add the user failed)**

    User Admins were experiencing an issue where an error would be thrown ("Request to add the user failed") when attempting to send a user invite. In some instances, despite this error message being displayed, the user invite still went through to the invited user. However, there was still a high failure rate when sending user invites.

    This release contains a fix that will allow user invites to be sent successfully and prevent the erroneous display of the above error. In addition, a confirmation message will be shown when a user invite has been successfully sent.

DATIM Release 1.18b was deployed on December 21st, 2016.

DATIM v1.18b is a follow on release to address some of the issues from release v1.18.

Resolved Defects:

1. **Fix to null codes**

    Added codes for the following data elements
    *   dataset
    *   dataelementcategory
    *   dataelementcategoryoption

2. **Added entityID attribute to the OU for data exchange**
