

DATIM Release 1.20c was deployed as an off cycle maintenance release on February 10th, 2017.

DATIM v1.20c updates a data element mapping for the TX_NEW data element.

Resolved Defects:

1. TX_NEW indicator was incorrectly mapped to the TX_CURR data element for FY18 Targets

The TX_NEW indicator is now mapped correctly to the TX_NEW data element, which will allow users to view it correctly in the system, particularly in pivot tables. Prior to the deployment, a query was run to verify that no data was entered against this indicator to ensure data was not inadvertently deleted.
