DATIM Release 1.22.c was deployed as an off-cycle release on October 18, 2017.

DATIM v1.22.c updates MER data entry screen bugs for VMMC_CIRC and OVC_SERV.

MER Updates:

1. **VMMC_CIRC**
   An incorrect validation rule summed the Technique by Follow-up Status disaggregate. Despite the failed validation, there should not be concern about data loss since data entered for this MER indicator was captured by the system after a value was entered and the data entry field turned green. This issue has been resolved.

2. **OVC_SERV (MER Results: Facility Based)**
   An invalid operation made the Conditional DREAMS SNUs disaggregate mutually exclusive from the Required Age/Sex disaggregate. This issue has been resolved and a separate communication sent to potentially impacted DREAMS OUs.

3. **OVC_SERV (MER Results: Community Based)**
   An additional validation rule was incorrectly applied to the Conditional DREAMS Disaggregate by Age/Sex/Service Area. Despite the failed validation, there should not be concern about data loss since data entered for this MER indicator was captured by the system after a value was entered and the data entry field turned green. This issue has been resolved.

   The Numerator Auto-calculation field was not displayed correctly on the Community Based data entry form. This has also been resolved. There should not be concern about data loss since the numerator for OVC_SERV is calculated by the Program Status disaggregate, which is functioning correctly.
