

**DATIM Release 1.23.g** was deployed as a maintenance release on March 13, 2018.

DATIM 1.23.g includes a fix to the Data Deduplication app.

**Fixes:**

- **Resolved issues with erroneous duplicates in DSD/TA crosswalk duplicates**

Background on this issue can be found on DATIM Support [here](#). Erroneous duplicates existed when a DSD/TA duplicate was created, but either the DSD or TA value was subsequently deleted, causing the duplicate to display with a single value. This fix has removed all existing “erroneous” duplicates and will prevent these duplicates from displaying in the future. Please note that the existence of the duplicates did not impact current or existing data in any way.
