

DATIM Release 1.24.g was deployed as a maintenance release on July 19, 2018.

DATIM 1.24.g includes an update to DATIM data validation rules.

Update:

- **Remove HIV Prevalence Validation Rule in DATIM**

In DATIM, the standard DATIM MER data entry validation rule was removed from two indicators for HIV Prevalence. The overall prevalence value for these indicators can be either less than, greater than, or equal to the disaggregated values whereas the standard validation rule only allows the sum of disaggregates to be less than or equal to the numerator/denominator total.
