

DATIM Release 1.31.z was deployed on July 07, 2021.

DATIM 1.31.z includes updates to the User Administration application.

Update:

The User Administration application in DATIM has been updated with several feature enhancements that will change the look and feel of the application.

- The radio buttons to select data stream access that are displayed vertically have been transposed to three position sliders displayed horizontally. They function identically to the radio buttons in terms of permissions, but instead of clicking a radio button, a user administrator will slide the selector to the appropriate permission. This change was made in order to accommodate more data streams which will open in October for Q4 reporting.

- "MER Country Team"'s name has been updated to "MER Interagency".

- MCAE - VMMC Notifiable Adverse Events reporting is expected to be made available to DATIM users in the near future. This data stream is labeled "MCAE" in the DATIM User Administration App because of character length limitations – MCAE stands for Medical Circumcision Adverse Events. A broader and more detailed communication about this new reporting form will be sent out before it is made available in DATIM. For now, this update is only a cosmetic change to the User Admin App, in preparation for that later release.
